

南开大学中村实验室招生信息

从 2025 年 9 月起，南开大学中村实验室将招收数名有抱负的研究生（博士和硕士）以及在有机合成和电子显微镜方面有才华的博士后。**此招生和招聘信息长期有效。**实验室位于津南校区的前沿科学中心大楼六层。课题组学生成果丰硕，如今年在东京大学的博士毕业生 Sakakibara(榎原雅也)发表了一篇 Science,, 获得了东大校长奖；本科毕业生 Anzo(安藏美樹子)获得了学院奖。

申请请联系：nakamura@chem.s.u-tokyo.ac.jp;
课题组主页：<https://moltech.jp/ja/>。

中村教授获得瑞宝中绶章及紫绶褒章

PHASE TRANSITIONS

Nondeterministic dynamics in the η -to- θ phase transition of alumina nanoparticles

Masaya Sakakibara¹, Minoru Hanaya², Takayuki Nakamuro^{1*}, Eiichi Nakamura^{1*}

Phase diagrams and crystallography are standard tools for studying structural phase transitions, whereas acquiring kinetic information at the atomistic level has been considered essential but challenging. The η -to- θ phase transition of alumina is unidirectional in bulk and retains the crystal lattice orientation. We report a rare example of a statistical kinetics study showing that for nanoparticles on a bulk Al(OH)_3 surface, this phase transition occurs nondeterministically through an ergodic equilibrium through the molten state, and the memory of the lattice orientation is lost in this process. The rate of the interconversion was found to be insensitive to the electron dose rate, and this process had a small Gibbs free energy of activation. These nondeterministic kinetics should be a key feature of crystal nucleation occurring in high-surface-energy regions of bulk crystals.

Crystal phase transitions are often irreversible and thus deterministic processes. For example, alumina (Al_2O_3) undergoes a series of irreversible first-order phase transitions with increasing temperature as it transforms from hydrated alumina [bayerite, $\alpha\text{-Al(OH)}_3$] into the metastable η phase, the θ phase, and finally the most stable α phase previously reported (Fig. 1A) (1). The transitions in

ML becomes the most stable only at 2300 K. Here, the η -to- η and θ -to- θ transitions refer to the NP changing its orientation relative to the bulk Al(OH)_3 substrate.

Thus, the η -to- θ phase transition of alumina, which is unidirectional in bulk, occurs nondeterministically through a rapid η/θ equilibrium that occurs through melting and recrystallization of NPs on the bulk Al(OH)_3 surface

represent a rare demonstration of the capability of real-space TEM observation for elucidation of the mechanism of chemical events through statistical mechanical analysis (11, 12).

These kinetics data obtained for NPs grown from Al(OH)_3 crystallites align with the thermodynamics of nanosized alumina polymorphs that Navrotsky *et al.* studied for NPs prepared by gas-phase condensation (13). The Navrotsky data, combined with the data that we present here, suggest that nondeterministic kinetics is a common feature of crystal nucleation in high-surface-energy regions of alumina crystals. The discrepancy between the lattice retention in bulk and the scrambling at the nanoscale suggests that the bulk experiment observations (4) result from an interplay between localized disorder in high-energy nanoregions and the overarching order imposed by the surrounding bulk crystal structure (14). Combined with the atomistic mechanism of bulk crystal disordering (15), this disparity challenges traditional views of phase transitions based on macroscopic analyses and underscores the necessity for caution when extrapolating macroscopic data to comprehend their atomistic mechanism. The observed kinetics and the EDR insensitivity indicate that the surface energy is more influential than has been gen-

commentary

Nakamura and Sato, *Nature Materials*, March Issue, 2011.

Managing the scarcity of chemical elements

The issues associated with the supply of rare-earth metals are a vivid reminder to all of us that natural resources are limited. Towards the sustainability of the periodic table, we must work together to manage the scarcity of chemical elements.

Eiichi Nakamura and Kenji Sato

For chemists and materials scientists, the period from the 1960s to the 1980s was an era when pioneers were racing through the unexplored and fertile wilderness of the periodic table, searching for treasure suitable for technical applications. Indeed, a number of new materials have been discovered during this period, including high-temperature superconductors, rare-earth magnets, and various types of semiconductors.

目标:培养让世界都能看到他们面孔的科学家

希望在从本科研究到研究生阶段期间能掌握的内容:令世界引以为傲的教育与研究

能够用英语交流、阅读、书写、生活，并了解世界

- * 外国人学生、博士研究员、短期留学生との研究生活
- * 英語文献の英語講読(毎週木曜で年に2回担当)
- * 自分自身の研究の英語発表と英語資料作成(毎週木曜で4週ごとに回る)
- * 外国研究室での短期研究留学(D1学生全員:欧米・中国)
- * 外国人講演者との昼食会(大学院生)
- * Academic English in Chemistry(D1, COE講義)

能够流利表达，并使人信服

- * 4年生全員が3月の日本化学会で発表を目標
- * サブグループセミナー(非公式討論会:毎週木曜夕方、通常4グループで一順), グループセミナー(公式発表会:春秋2回、持ち時間10分で全員発表)
- * 研究室内での様々なレベルでの議論(大学研究室とERATO研究室)
- * 国内外研究室との共同研究

能够明白什么是非模仿的研究

为此必备的条件:

吃得好、喝得好、玩得好

- * 公式:お花見・新人歓迎会、春季蓼科セミナー+ハイキング+バーベキュー、理学部園遊会打ち上げ、春季研究室運動会、ソフトボール祝勝会、短期留学歓送迎会、夏の大掃除、院試合格祝い、秋季研究室運動会、秋季蓼科セミナー+ハイキング+バーベキュー、研究室同窓会、忘年会、学位審査通過祝賀会
- * 非公式:各グループ毎の懇親会、スキー旅行

Gilbert Stork 教授

首先是1C:好奇心(探求心)

好奇心(curiosity)を大切にして、勇気(courage)を持って困難な問題に挑戦すること(challenge)。必ずできるという自信(confidence)を持って、全精力を集中(concentration)し、そして諦めずに継続すること(continuation)。その中でも最も重要なのは、curiosity, challenge, continuation の3Cである。これが凡人でも優れた独創的と言われる研究を仕上げるために必要な要素であると私は考える。(本庶佑京大医学部教授)

Our challenges may be new...But those values upon which our success depends - hard work and honesty, courage and fair play, tolerance and curiosity, loyalty and patriotism - these things are old. These things are true.

希望掌握的内容:物(分子)制造技术 + 概念构建的思维方式

包括反应机理与电子显微镜
